

Annex on the obligation to declare the use of generative AI for graded assignments

1. Area of application

This annex (hereinafter referred to as the “Annex”) to the guidelines on the [Use of generative AI systems as part of assessments](#) (hereinafter referred to as the “AIG”) establishes in a binding manner the obligation to declare the use of generative AI systems arising from section 6.2 of the AIG. However, it shall only apply in circumstances where the individuals responsible (see definition under section 3 of the “AIG”) have not further specified the scope and the level of detail required under the declaration obligation in accordance with subject-specific and examination-didactic requirements.

The provisions contained herein are therefore subsidiary¹ in nature. It is ultimately incumbent upon the individuals responsible to ensure that students or continuing education participants receive clarity in a timely and appropriate manner as to whether any further specifications are in place with respect to the obligation to declare the use of generative AI systems in graded assignments or whether, in the absence of specific requirements, the provisions of this Annex apply.

2. Definition

This Annex primarily addresses text and image generation by generative AI systems and not topics such as “AI and programming code.” If the use of code assistants or similar tools is relevant to the nature of a graded assignment, the individuals responsible are required to describe the declaration obligation in more detail. Examinations are also not covered (see definition under section 6.1 of the AIG). In the case of examinations, the individuals responsible are required to independently govern and communicate the use of generative AI systems.

3. Declaration obligation

Generative AI systems must be cited in the same way as other aids, resources and sources if the output (see definition under section 5 of the AIG) generated by such tools is incorporated in a graded assignment. The share or extent of the contribution made by generative AI systems to the creative output generated as part of a graded assignment must be recognisable to third parties.

The following declaration obligations apply within the scope of this Annex:

- I. A generative AI system must be **cited in the text of a graded assignment** if content (text, images, data, etc.) created using this tool is paraphrased, quoted or incorporated in words to the same effect in the graded assignment in question.

Citation guidelines, using the example of the American Psychology Association (APA)²:

1. Author of the model (e.g. OpenAI as the author of the ChatGPT large language model)
2. Date (i.e. the year in which the generative AI system was used (and not the exact date of use))

¹ The provisions specified in this Annex thus serve as an “alternative” if no others have been specified.

² Source: <https://apastyle.apa.org/blog/how-to-cite-chatgpt>, accessed on 12 December 2024.

3. Image identifiers (for images created using generative AI systems, the (initial) prompt must be stated as the image identifier in quotation marks)

Examples (in-text reference):

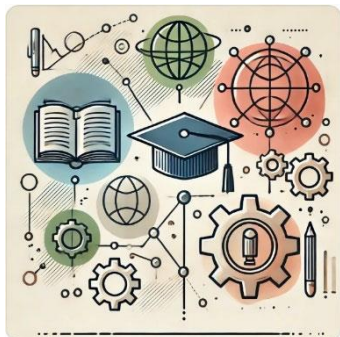

- Verbatim use of output: “Education management takes place at various levels, ranging from the administration of individual educational institutions such as schools, universities and continuing education centres to the management of entire education systems”

(OpenAI, 2024).

- Paraphrasing of output:
- Education management occurs at different levels, from the administration of single educational institutions to the control of entire education systems.
- (OpenAI, 2024).
- Translation:
- “Bildungsmanagement findet auf verschiedenen Ebenen statt, von der Verwaltung einzelner Bildungseinrichtungen wie Schulen, Hochschulen oder Weiterbildungszentren bis hin zur Steuerung ganzer Bildungssysteme”

(DeepL, 2024).

- Image:

“Symbolism for education management” (OpenAI, 2024).

- II. If generative AI systems are used as in section 3.I or otherwise used for text creation purposes (e.g. literature research or as a structuring aid) or for the (further) editing of the student's or continuing education participant's own data or previously generated output, **the tools used and the purpose of their use must be listed and made transparent within the graded assignment, for example in a specific list of aids.**

If a reference management programme (e.g. Zotero) is used that lists the generative AI systems in a general bibliography and the purpose of their use cannot be stated in the bibliography itself, it must be ensured that the purpose of use of the deployed AI systems is documented in detail in the method reference in accordance with section 3.IV (see example 2 under section 3.IV).

Citation guidelines, using the example of the American Psychology Association (APA)³:

³ Source: <https://apastyle.apa.org/blog/how-to-cite-chatgpt>, accessed on 12 December 2024.

1. Author of the model (e.g. OpenAI as the author of the ChatGPT large language model)
2. Date (i.e. the year in which the generative AI system was used (and not the exact date of use))
3. Title (i.e. name of the model, e.g. ChatGPT in *italics*)
4. Version (i.e. designation of the version or versioning)
5. Source (i.e. URL link)

Examples (specific list of aids):

- Bibliography:
[...]
 - List of generative AI systems used:
 - OpenAI. (2024). *ChatGPT* (version 4).
<https://chat.openai.com/chat>
 - Generation of text proposals
 - Development of a methodology
 - Data processing
 - Generation of questionnaires
 - Structuring aid for subdividing the graded assignment
 - Open AI. (2024).
<https://openai.com/dall-e-3>
 - Image generation
 - DeepL (2024). *DeepL Translator* (version DeepL Pro).
<https://www.deepl.com/translator>
 - Translation of text passages
 - Litmaps (2024). *Litmaps* (free version).
<https://www.litmaps.com>
 - Literature research
- III. The **prompts** that were used in the dialogue with the generative AI systems as well as the corresponding output do *not* have to be declared, i.e. they do not have to be stated or listed (see image identifiers as an exception under section 3.I) either as an “in-text reference” (section 3.I) or as a “list of aids reference” (section 3.II).
- IV. In order to make it easier to recognise the share or extent of the contribution made by generative AI systems to the creative output generated as part of a graded assignment as well as to document the quality of the student's or continuing education participant's own scientific work, **a description of how generative AI systems were used in the graded assignment must generally be provided in the introduction or in the method section.** The description must include an explanation of the extent to which generative AI systems have been used as a means of stimulating thought or as a source of inspiration. If generative AI systems are also used for purposes described under section 3.I or 3.II, this must likewise be documented. If the purpose of use is specifically stated in the list of

generative AI systems used (section 3.II), a summary description in the method reference is sufficient.

Examples (method reference):

- Example 1 (summary description in the case of a specific list of aids):

Introduction

[...]

Finally, it should be mentioned that generative AI systems and tools were used as a source of inspiration and for initial brainstorming. In particular, the critical dialogic interaction with [...] and its contents enriched my work and the quality of my scientific output. Using the model not only enabled me to generate ideas, but also to recognise the limitations and possible distortions in the generated content, for example as regards the aspect of [...]. This fostered a deeper understanding of the use of language technologies and raised my awareness with respect to critically reflecting upon their use in my work. On the other hand, AI tools were used for, among other things, researching literature, structuring my work into sub-sections, summarising literature, understanding content, formulating texts and generating images. Reference can be made here to a specific list of the aids employed.

- Example 2 (detailed description where no specific list of aids exists or if it is not possible to state the purpose of use of generative AI systems in the general bibliography itself when using reference management programmes):

Introduction

[...]

Finally, it should be mentioned that generative AI systems and tools were used as a source of inspiration and for initial brainstorming. In particular, the critical dialogic interaction with [...] and its contents enriched my work and the quality of my scientific output. Using the model not only enabled me to generate ideas, but also to recognise the limitations and possible distortions in the generated content, for example as regards the aspect of [...]. This fostered a deeper understanding of the use of language technologies and raised my awareness with respect to critically reflecting upon their use in my work. On the other hand, ChatGPT was used to improve the title of the assignment [research question], structure my work into sub-sections, summarise literature, understand content, formulate texts and generate images. Litmaps was also used for researching literature.

- V. The use of generative AI systems is **exempt from the declaration obligation**:
- a. when used as a formulation and/or spelling aid (language support) or
 - b. for autocompletion purposes.

For this purposes, it is assumed that the content and creative output is generated by students and continuing education participants.

4. Responsibility

Responsibility remains with the students or continuing education participants. Even if they correctly declare the use of generative AI, students and continuing education participants are still required to check the relevance, truthfulness and accuracy of the generative AI systems used and the output they produce (especially in the case of literature research and sources) given the risk of hallucinations.

Graded assignments must also represent independent work performed by the students or continuing education participants (see also section 7 of the AIG). Students and continuing education participants must use generative AI systems in a reflective, critical and targeted manner.

Finally, it should be noted that personal data and other data requiring heightened protection as well as data that is subject to contractual or legal confidentiality must not be processed using generative AI systems unless these systems have been reviewed and approved⁴ by the ZHAW with respect to their data protection compliance.

5. Regulation information

The original German version of the policy can be found here:
[Z-RL-Richtlinie Anhang Deklarationspflicht KI bei Arbeiten](#)

5.1 Metadata

Subject	Content
Issued by	Head of the Academic Affairs Unit
Decided by	Head of the Academic Affairs Unit
Subject classification	2.05.00 Academic Programmes, Studies / 5.04.00 CE Implementation
Publication type	Public

5.2 Issued by

Version	Decision	Decided by	Validity	Description of change
1.0.0	28/11/2023	Head of the Academic Affairs Unit	01/12/2023	Original version
